### **Emulsion Breakers**

---

Emulsion Breakers are applied when there is water in oil or oil in water. As an emulsion contains water, it becomes very problematic for oil and gas producers. In oil production today, water is an inevitable byproduct and this water must be removed before it can be taken to the refinery. In addition, oil can also get trapped in the water and cause injection well problems adding to the loss of revenue because the oil is disposed of with the water. In order to prevent these problems, Lone Star Industries' Emulsion Breakers are applied accordingly to either prevent this from occurring or treat the already existing emulsion.
